IMPLEMENTATION COMMENTS

In the file script.js I have written comments in each function to describe what they do.

Talking about difficulties for me to implement the code, the main one came because I thought it should be useful for user to introduce two additional features: by one hand, the possibility of editing the text of a task once it has been created, and in the other hand the ability of deleting one single task, not only remove the checked tasks.

Following this, the most difficult thing for me was thinking about the design of the interface for these two features. First, I made the text content of the task editable and I added a delete button in each task, but in this way, if user typed the intro key, then the text went in a new line and the delete button moved into a strange position. I thought I need to write lot of css code and new div labels in the html to fix it, and for me it would have been hard to find the way to do that; also I thought it was little intuitive for the user, because without the edit button, and with no comments about this feature, maybe the user wouldn't realized that he could edit the task. So finally I decided to add the edit button. In this way it has been easier for me to implement and I think it's simple and intuitive for the user to have these two buttons in each task; its use affects each single tasks and the two main buttons affect app globally.

Finally I should say that I have not used a lot functions as `.parentNode`, `.childNode`, etc., and I should have been investigating in internet to work with them.
